

We, fuji electric wire industries, have been manufacturing tin-plated wires, which have various types under the strict manufacturing process as well as the severe quality control, applying over 40 years' experiences & supply records.

The materials used in the core wire are mainly copper-plated steel wire (CP wire), electro-oriented copper wire (Cu wire), phosphoric bronze wire (PBW) and other metallic wires.

Each material can be selected, depending on the applied conditions and also its purpose.

The shapes of these wire are classified into (1)Round wire, (2)Square wire, (3)Flat square and (4)Rollet wire and the size can be determined upon the customer's request.

All kinds of above wires can achieve a good performance in soldering process and also are most suitable for leading wire in the electronic components (transformers, coils and condensers, etc) which need the soldering process.

In fact, our wire products have been highly appreciated among, not only domestic customers, but also overseas customers.

For customers who desire each ; CP wire, harder Cu wire and PBW (for each type of round, square, flat square and rollet wire) , please contact us.
