

■ Rollet wire

By our own developed technology, the rollet wire can be produced.

The surface of wire is showing continuous groove patterns , which prevents displacement or loosening at the time of wrapping connection to bundle the fine wires without damaging the original wires.

This can lead to the stable operational efficiency finally. Also, the gas drawing effect in the parts' bobbin can be expected simultaneously.

Each size & distance of the groove patterns on both round and square wire can be requested and determined, depending on the application and also the conditions in use.
